

## 896 RAPIDFIRE AUTOMATIC KNIFE

The RapidFire features a dual action opening system for automatic or non-automatic deployment. The knife can be opened manually like a standard liner lock using the thumb surface. The blade locks open in this position and closes as you would a standard liner lock. The thumb surface on the blade can also be removed to show a thumb hole for easy, non-auto deployment. For automatic opening use your thumb to move the launch button upward toward the spine of the knife. The launch button activates the release mechanism that rapidly opens the blade to the locked open position.

## OPERATING INSTRUCTIONS

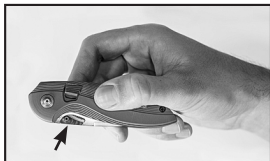

### To Open

To engage the blade, hold handle securely and use your thumb to remove the automatic deployment button away from the pivot. This will release the launch spring and the blade will open very quickly, locking in the open position.

### Removing Thumb Surface

1. Hold handle securely and locate the thumb surface on the blade of the knife.
2. Use a T6 driver to remove the fastener holding the thumb surface in place.
3. Carefully remove the left and right thumb surface.

*Due to the complex and changing nature of knife laws, it is the knife user's responsibility to investigate whether the purchase, possession and use of this knife comply with federal, state and local knife laws applicable to the user.*
